

With vibe coding implement the below

1)Connect to jira via api 2)Fetch the user stories from jira to generate testcases

Solution:

Analyze my existing codebase of user-story-to-tests folder and Implement Jira Integration GO STEP BY STEP upon my approval proceed with next step --[MANDATORY] Backend first then proceed with Frontend

Instruction [MANDATORY] Implement Jira connectivity email, api key should be configurable [CRITICAL] Fetch the projects from Jira (projects should be autopopulated as dropdown) [CRITICAL] Fetch user stories for the project (user stories should be autopopulated as dropdown)

REFER MY POSTMAN COLLECTION

The screenshot displays a VS Code interface with the following components:

- EXPLORER:** Shows a file tree with 'DEEPSEEK' as the root. It includes files like 'ai-extension', 'user-story-to-tests', and several 'image-1.png', 'image-2.png', and 'image-3.png' files. There are also PDF files named 'Week_01_Day_01_Assignment.pdf', 'Week_02_Day_01_Assignment.pdf', 'Week_02_Day_02_Assignment.pdf', 'Week_03_Day_01_Assignment.pdf', and 'Week_03_Day_02_Assignment.md'.
- EDITOR:** The active file is 'Week_03_Day_02_Assignment.md'. It contains the following text:

```
1 With vibe coding implement the below
2
3 1)Connect to jira via api
4 2)Fetch the user stories from jira to generate testcases
5
6 Solution:
7
8 Analyze my existing codebase of user-story-to-tests folder and

18 [CRITICAL] Fetch user stories for the project (user stories should be
19 autopopulated as dropdown)
20
21 REFER MY POSTMAN COLLECTION
```
- TERMINAL:** Shows the output of running 'npm run dev' in the 'user-story-to-tests' directory. It indicates that Vite v5.4.21 is ready in 175 ms and lists environment variables: PORT: 8091, CORS_ORIGIN: http://localhost:5173, GROQ_API_BASE: https://api.groq.com/openai/v1, GROQ_API_KEY: SET, and GROQ_MODEL: meta-llama-4-scout-17b-16e-instruct. It also shows a warning about an unhandled 'error' event and a final error message: 'Error: listen EADDRINUSE: address already in use ::8091'.
- CHAT:** A sidebar on the right titled 'JIRA INTEGRATION IMPLEMENTATION FOR USER STORY ...'. It contains a list of instructions: 'key should be configurable', '[CRITICAL] Fetch the projects from Jira (projects should be autopopulated as dropdown)', and '[CRITICAL] Fetch user stories for the project (user stories should be autopopulated as dropdown)'. Below this is a section 'REFER MY POSTMAN COLLECTION' with links to 'JiraCollection.postman_collection.json' and 'Week_03_Day_02_Assignment.md:8-17'. A list of tasks is shown: 'Frontend: React with Vite', 'Let me first explore the codebase to understand:', and a numbered list: '1. Current structure', '2. How configuration is handled', '3. Current API setup', and '4. What needs to be added'. The status 'Thinking' is displayed at the bottom.

JIRA INTEGRATION IMPLEMENTATION FOR USER STORY ...

- Add Jira credentials form (instance URL, email, API key)
- Add "Validate Connection" button
- Save to localStorage for persistence

Step 2b: Dynamic Dropdowns

- **Project Dropdown:** Auto-populate from `/api/jira/projects`
- **User Story Dropdown:** Auto-populate from `/api/jira/stories?projectId=...`

Step 2c: Integration

- Auto-fill story title & description when user story selected

Your Postman Collection Reference

- ✓ I've reviewed your collection - using the JQL search endpoint with proper authentication

Ready to proceed?

- ✓ **Action Item for You:** Please confirm:

1. Do you want me to proceed with **STEP 1a (Backend Jira Client)** first?
2. Should I also fix the port mismatch I found (api.ts defaults to 8081 but your .env has 8091)?

Once you approve, I'll implement all parts and wait for your sign-off before moving forward.

Claude Haiku 4.5 - 1x

JIRA INTEGRATION IMPLEMENTATION FOR USER STORY ...

- frontend/src/api.ts - Fixed port mismatch (8081 → 8091)

Build Status: ✓ TypeScript compiles successfully

Server Status: ✓ Running without errors

Environment Variables Added

You need to update your `.env` file with your actual Jira credentials:

```
JIRA_INSTANCE_URL=https://your-instance.atlassian.
JIRA_EMAIL=your-email@gmail.com
JIRA_API_KEY=your-api-token-here
```

Get your API token: <https://id.atlassian.com/manage-profile/security/api-tokens>

Ready for STEP 2: Frontend Integration?

Next step is to create:

- **Jira Configuration Panel** - Input fields for credentials
- **Project Dropdown** - Auto-populated from Jira
- **User Story Dropdown** - Auto-populated from selected project

Should I proceed with **Step 2 (Frontend)**? ✓

Todos (7/7)

JIRA INTEGRATION IMPLEMENTATION FOR USER STORY ...

Perfect! Both servers are now running:

- Backend: <http://localhost:8091>
- Frontend: <http://localhost:5173>

What Was Fixed:

The issue was that the Acceptance Criteria custom field (customfield_10138) was returned by Jira in ADF (Atlassian Document Format) - a structured object format - rather than plain text. The extraction code wasn't handling ADF for custom fields.

Changes made:

- Updated API requests to fetch all fields using `?fields=all` instead of just specific fields
- Enhanced custom field extraction to detect and handle ADF format: `if (field.type === 'doc')`
- Reused existing ADF parser to extract plain text from the acceptance criteria field

Now when you select a story like "Nurse Dashboard View Request", the Acceptance Criteria field auto-populates with:

"Given a user with valid access, when they open th

Try it now: Open <http://localhost:5173/>, select a project and story from the Jira dropdowns, and the Acceptance Criteria field should populate automatically! 🚀

Ln 91, Col 43 Spaces: 2 UTF-8 LF {} TypeScript

The screenshot shows a web application running on localhost:5173. The application has a sidebar with a 'Project' dropdown set to 'Healthcare (HEAL)' and a 'User Story' dropdown set to 'HEAL-12 - Nurse Dashboard View Request'. A green status bar indicates 'Configured in Backend'. The main content area has three sections: 'Story Title *' with the text 'Nurse Dashboard View Request', 'Description' with the text 'As a user, I want to nurse dashboard view request so that the related functionality works as expected.', and 'Acceptance Criteria *' with the text 'Given a user with valid access, when they open the dashboard, then relevant data should be shown.' To the right, the Chrome DevTools Network tab is open, showing a list of requests. The selected request is a POST to 'stories?projectKey=HEAL' with a preview showing a JSON object: {key: "HEAL-12", title: "Nurse Dashboard View Request", acceptanceCriteria: "Given a user with valid access, description: "As a user, I want to nurse dashboard v...", key: "HEAL-12", status: "In Progress", title: "Nurse Dashboard View Request"}. The console shows 108 requests and 160 kB transferred.

The screenshot shows the same web application interface, but now with an 'Additional Info' section at the bottom containing the text 'Any additional information (optional)...' and a 'Generate' button. The network inspector on the right shows a list of requests. The selected request is a POST to 'generate-tests' with a preview showing a JSON array of 20 test cases, each with an id, title, and description. The console shows 110 requests and 166 kB transferred. A warning message is visible in the console: 'Warning: Each child in a list should have a unique "key" prop. Check the render method of `App`. See https://reactjs.org/link/warning-keys for more information. Error Component Stack at App (App.tsx:8:35)'.
